

This switching unit is required for automatic redundancy switching of L-Band signals in the frequency range 900...1500 MHz.

### Design

The unit is housed in a 19" subrack with very good RF shielding and consists of the following sub-assemblies:

- solid-state switches DPDT
- attenuators, fix and programmable
- amplifiers
- control logic
- redundant power supply modules
- LAN interface
- mimic with manual control

All the necessary signal and power supply connections as well as the mains switches are provided at the rear.

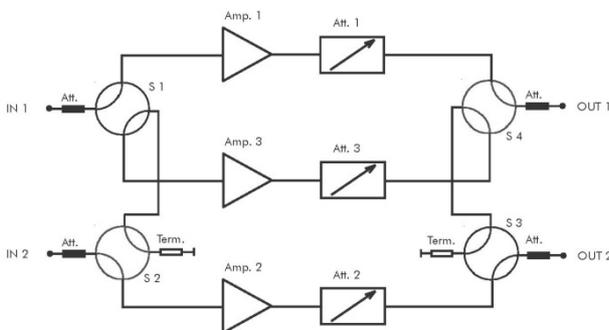

### Control

The unit is controlled via a LAN interface. Gain setting and selection of the RF path could be also done manually on the front panel.

### Special features

A status string can also be requested at any time via the control interface.

The unit is constructed using a modular approach utilising plug-in sub-assemblies which enable ease of installation and maintenance.
